

Day 3 mid-session exercises

The Agentic Artefact Set

Four short exercises. Each takes five to seven minutes. You choose options and type a short answer into the chat. Nothing to write out.

The running product is **SkyWays Booking**, the same one from the session. Everything you need is on the slides you have already seen.

How to answer: type your letters as one line, for example **1b 2d 3a** . Where an exercise asks for a set, type all the letters that apply.

Exercise 1 — Which artefacts does this feature owe?

Format: multi-select. Time: 6 minutes.

A new feature lands on the SkyWays backlog.

Seat-preference agent. When a booking is confirmed, the agent reads the passenger's past bookings, predicts the seat they are likely to want, and reserves it automatically. If the flight is full in that cabin it does nothing. It never charges anything and never contacts another airline.

Work it through the artefact sheet. Below are the ten artefacts. Type the letters of every artefact this feature owes.

Artefact		Artefact	
a	Problem brief	f	Statistical acceptance plan
b	Agent spec	g	Open-decisions log
c	Autonomy line	h	Agent registry entry
d	Acceptance bar	i	Autonomy spec (detailed)
e	Tool contract	j	Rollback runbook

Then answer one more, single-select:

1k. What is this agent's autonomy ceiling?

- a. L1, approve first
- b. L2, act and tell
- c. L3, act alone

Exercise 2 — Complete the decision tree

Format: fill the branches. **Time:** 5 minutes.

Here is the conditional-artefact decision tree with three of its four leaves blanked out. Each blank is a ?. Match each blank to the right artefact from the bank.

The bank:

- p. Open-decisions log
- q. Autonomy spec
- r. Rollback runbook
- s. Statistical acceptance plan
- t. Tool contract

Type your matches as 1-? 2-? 3-?, for example 1-p 2-q 3-s.

One of the bank options is a distractor that fits no blank. You do not have to name it, but you should not use it.

Exercise 3 — Spot the ceiling that is wrong

Format: single-select plus a follow-up. **Time:** 6 minutes.

A colleague scored the actions for a **baggage-claim agent** and wrote its ceiling underneath. Read the table.

The action	Reversible?	Hurts if wrong?	Level it allows
Read the baggage record	Yes	No	L3
Look up the compensation policy	Yes	No	L3
Send the passenger an update	No	No	L2
Pay interim expenses to the passenger's card	No	Yes	L1
Their written ceiling			L2 act and tell

3a. Is the ceiling correct?

- a. Correct
- b. Wrong

3b. If it is wrong, which single fact makes it wrong?

- c. Sending an update cannot be taken back
- d. Paying interim expenses is irreversible and hurts if wrong
- e. Looking up a policy could return an outdated policy
- f. Reading the record is the only fully safe action

Type your answer as **3a - ? 3b - ?** .

Exercise 4 — The guardrail decision

Format: single-select chain. Time: 7 minutes.

The **codeshare-rebooking agent** decides routes across partner airlines. Here are its numbers.

- One right answer saves **\$8** of handling.
- One wrong answer costs **\$48**: a wrong reissue, a refund, and a service credit.
- The team measures the model at **82% correct** on the codeshare slice.

4a. What acceptance bar does this agent have to clear?

Use the 1-in-N idea: rights per wrong is damage divided by saving, and the bar is one minus one over that plus one.

- a. 50%
- b. 80%
- c. 86%
- d. 90%

4b. At 82% measured, does it clear the bar?

- e. Yes, ship it
- f. No, it is below the bar

4c. The team adds a hold: a person approves any codeshare reissue before it is charged. A wrong answer now costs only the \$8 of wasted handling. What is the new bar?

- g. 40%
- h. 50%
- i. 60%
- j. 75%

4d. At 82% measured, does it clear the new bar?

- k. Yes, the hold made it shippable
- l. No, it is still below

Type your answer as 4a-? 4b-? 4c-? 4d-? .

Exercise 5 — Match the feature to its build (bonus, if time)

Format: matching. Time: 5 minutes.

Match each SkyWays feature on the left to the build it needs on the right. Each build is used at least once.

Features:

1. Notify a passenger when their gate changes
2. Choose the best of several rebooking options for a delayed flight
3. Refund a cancelled booking inside a fixed policy, no judgement
4. Rebook a multi-leg international trip across partner airlines end to end

Builds:

- w. Rule or workflow (no model)
- x. Assisted (model suggests, person decides)
- y. Agentic (model decides across tools)

Type your matches as 1-? 2-? 3-? 4-? .

Answers are released after you have submitted. Type your letters in the chat.
