

Which artefacts does this feature owe?

Seat-preference agent on SkyWays Booking. Answer: a b c d e f i owed, and 1k = c (L3).

Teaching point. Mandatory artefacts are owed by what the agent is. Conditional ones by what it *does*. The autonomy spec is owed only when a model acts, not merely when the agent acts.

How you decide, for any artefact

Two questions place every artefact into one of three duties.

The seat agent, artefact by artefact

SEAT-PREFERENCE AGENT

7 of 10 artefacts owed

M	Problem brief	OWED	every agent needs a reason
M	Agent spec	OWED	the buildable description
M	Autonomy line	OWED	how much it decides alone
M	Acceptance bar	OWED	the number it must hit
M	Tool contract	OWED	what it may touch
C	Statistical acceptance plan	OWED	it predicts, so output is probabilistic
C	Autonomy spec (detailed)	OWED	a model decides AND it acts
C	Open-decisions log	skip	nothing unresolved
C	Agent registry entry	skip	it runs alone
O	Rollback runbook	skip	no high-impact action

Owed: a b c d e f i. Ceiling 1k = c, L3 act alone, because every action is reversible and harmless.

Why L1 and L2 are wrong for 1k. L1 needs an action that is irreversible and harmful; this agent has none. L2 needs one that is irreversible but harmless, like the confirmation email in the deck; again none. Reserving a seat can be released and hurts nobody, so nothing pulls the ceiling below L3.

The common miss. Leaving off **i**, **the autonomy spec**. Many stop at the five mandatory plus the statistical plan because the actions feel harmless. It still acts on a model's decision, so the spec is owed.
