

Complete the decision tree

Match each blank leaf to its artefact. Answer: 1-q, 2-s, 3-p.

Teaching point. Each conditional artefact is tied to one specific trigger. Reading the tree is matching a leaf to its condition, never guessing.

The completed tree

THE DISTRACTOR: t. Tool contract

It is a real artefact but MANDATORY, so it never hangs off a trigger. r. Rollback runbook is unused.

1-q Autonomy spec · **2-s** Statistical acceptance plan · **3-p** Open-decisions log.

The trap: t, Tool contract. It is a real artefact, but it is *mandatory*, not conditional, so it never hangs off a trigger in this tree. Placing it means confusing a mandatory artefact for a conditional one, which is the distinction the whole session turns on. **r, Rollback runbook** is the unused bank option; it is optional and tied to high-impact actions, not to any of these three conditions.
