

Match the feature to its build

Answer: 1-w, 2-x, 3-w, 4-y.

Teaching point. Most of a backlog is not agentic. Naming the build for each feature is what takes rules out of the AI conversation.

Feature to build

FEATURE		BUILD	
Notify on a gate change	→	RULE / WORKFLOW	a fixed trigger fires a message, no model
Choose the best rebooking option	→	ASSISTED	a model ranks, a person picks
Refund inside a fixed policy	→	RULE / WORKFLOW	fixed rules, deterministic, no judgement
Rebook a multi-leg trip end to end	→	AGENTIC	a model decides across several tools
TWO OF FOUR NEED NO MODEL. Features 1 and 3 are rules, so they leave the AI backlog entirely. That is the point of the exercise.			

1-w Rule · 2-x Assisted · 3-w Rule · 4-y Agentic.

The point to land. Two of the four features need no model at all. In a real backlog that share is often higher than the room expects, and those rows leave the agentic work entirely. Shrinking the list of things that actually need an agent is the most useful thing a PM can do with this framework.
